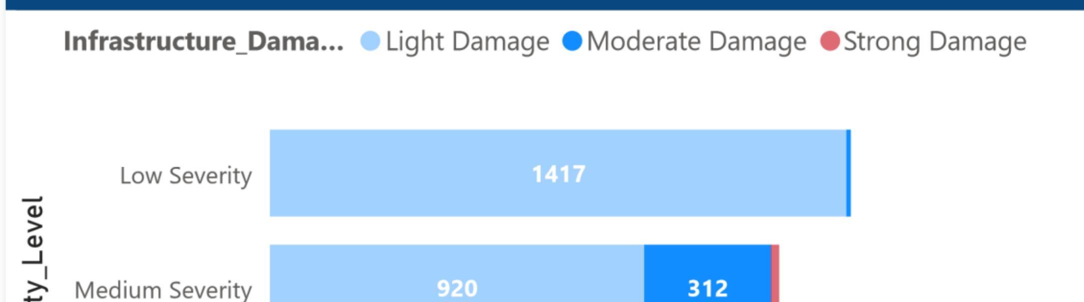
Does Higher Severity Lead to Greater Infrastructure Damage?



Are International Aids Aligned with Economic Losses?

Power BI Desktop

Insight

*   **The findings indicate that disasters in the dataset were more widespread than deadly, as total deaths and injuries accounted for less than 1% of the total affected population. This suggests that the major impact of disasters was on livelihoods, displacement, infrastructure, and socio-economic stability rather than direct mortality.**

*   **A moderate relationship exists between the affected population and economic losses, indicating that disasters impacting larger numbers of people are often associated with higher economic damage, even when mortality rates remain relatively low.**

*   **Disaster severity is one of the strongest drivers of infrastructure damage. Therefore, governments should prioritize resilient urban planning, effective crisis management systems, and adaptive infrastructure strategies to reduce future disaster impacts and improve long-term resilience.**

*   **The international aid distribution observed in the dataset does not appear fully equitable, as aid allocation seems to focus primarily on events with high economic losses while giving less consideration to the scale of human impact and the number of affected individuals.**

*   **International organizations and donor agencies should adopt a more comprehensive aid allocation approach that considers both economic losses and human impact indicators, ensuring a fairer and more sustainable distribution of resources among affected countries.**

*   **Even when economic loss is used as a major allocation criterion, concentrating most aid on only two countries among many affected nations highlights a significant imbalance in global disaster assistance mechanisms.**

*   **On the other hand, affected countries should improve disaster reporting, transparency, and damage documentation processes in order to provide accurate information that can support faster and more appropriate international assistance.**

*   **Overall, the analysis highlights that achieving sustainable development requires not only economic growth, but also resilient infrastructure, effective disaster preparedness, equitable international support, and stronger protection for vulnerable populations.** Analysis Methodology
